

September 2008

To Whom It May Concern:

This will attest to the superior experience we have had with the EcoloBlue 28 liter atmospheric water generation system. We began with one in our reception area as a test and part of our commitment to Quality and Sustainability.

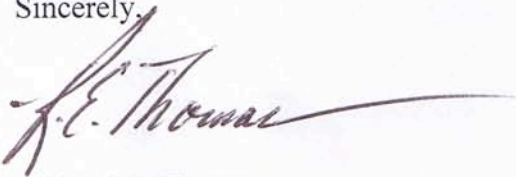

Not only have our customers been favorably impressed with this visible evidence of our commitment, but they have raved about the quality of the water and are fascinated with the energy efficiency characteristics of the EcoloBlue system.

Pulling water out of the air not only makes sense in so many ways, but it also eases the dehumidification burden on our HVAC systems. Interestingly, the evidence gathered by our computerized controlled air-conditioning system suggests that the cooling demand on the area in which our EcoloBlue unit stands is significantly lower than in surrounding areas ... and this is likely due to the lower humidity in that area due to the presence of the unit.

The other main benefit we experience is with our employees, whose understanding that we are no longer using the bottles with polycarbonate plastic to hold water in coolers, since that has been acknowledged to have potential carcinogenic properties, is a signal to them that we care about their wellbeing.

I enthusiastically recommend the EcoloBlue 28 system to all employers, and we have a firm belief that our investment will be paid back within two years; and we already know that the acknowledgement of our investment in energy efficient and pure water provision has brought us significant good will among our customer base.

Sincerely,

Richard E. Thomas  
Chief Executive Officer
